

# Scalable IO in Java

Doug Lea

State University of New York at Oswego

[d1@cs.oswego.edu](mailto:d1@cs.oswego.edu)

<http://gee.cs.oswego.edu>

# Outline

---

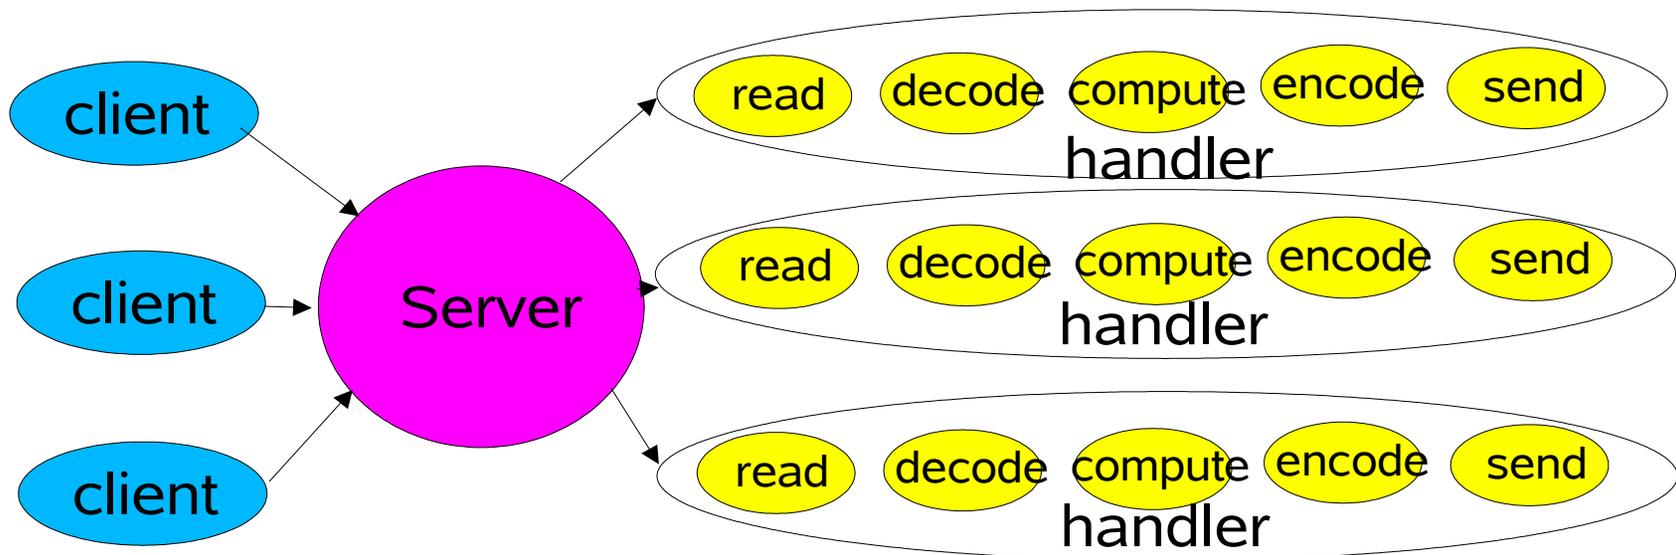

- " Scalable network services
- " Event-driven processing
- " Reactor pattern
  - Basic version
  - Multithreaded versions
  - Other variants
- " Walkthrough of java.nio nonblocking IO APIs

# Network Services

---

- " Web services, Distributed Objects, etc
- " Most have same basic structure:
  - Read request**
  - Decode request**
  - Process service**
  - Encode reply**
  - Send reply**
- " But differ in nature and cost of each step
  - XML parsing, File transfer, Web page generation, computational services, ...

# Classic Service Designs

Each handler may be started in its own thread

# Classic ServerSocket Loop

```
class Server implements Runnable {
    public void run() {
        try {
            ServerSocket ss = new ServerSocket(PORT);
            while (!Thread.interrupted())
                new Thread(new Handler(ss.accept())).start();
            // or, single-threaded, or a thread pool
        } catch (IOException ex) { /* ... */ }
    }

    static class Handler implements Runnable {
        final Socket socket;
        Handler(Socket s) { socket = s; }
        public void run() {
            try {
                byte[] input = new byte[MAX_INPUT];
                socket.getInputStream().read(input);
                byte[] output = process(input);
                socket.getOutputStream().write(output);
            } catch (IOException ex) { /* ... */ }
        }
        private byte[] process(byte[] cmd) { /* ... */ }
    }
}
```

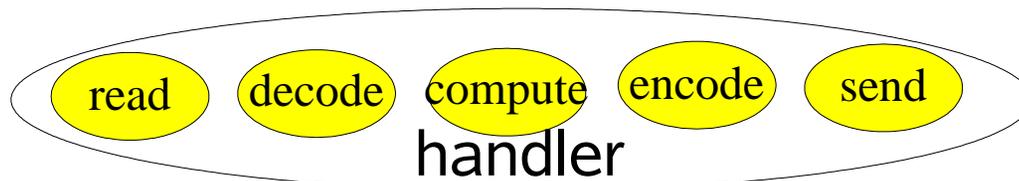

*Note: most exception handling elided from code examples*

# Scalability Goals

- " Graceful degradation under increasing load (more clients)
- " Continuous improvement with increasing resources (CPU, memory, disk, bandwidth)
- " Also meet availability and performance goals
  - Short latencies
  - Meeting peak demand
  - Tunable quality of service
- " Divide-and-conquer is usually the best approach for achieving any scalability goal

# Divide and Conquer

- " Divide processing into small tasks
  - Each task performs an action without blocking
- " Execute each task when it is enabled
  - Here, an IO event usually serves as trigger

- " Basic mechanisms supported in java.nio
  - Non-blocking** reads and writes
  - Dispatch** tasks associated with sensed IO events
- " Endless variation possible
  - A family of event-driven designs

# Event-driven Designs

- Usually more efficient than alternatives

Fewer resources

- Don't usually need a thread per client

Less overhead

- Less context switching, often less locking

But dispatching can be slower

- Must manually bind actions to events

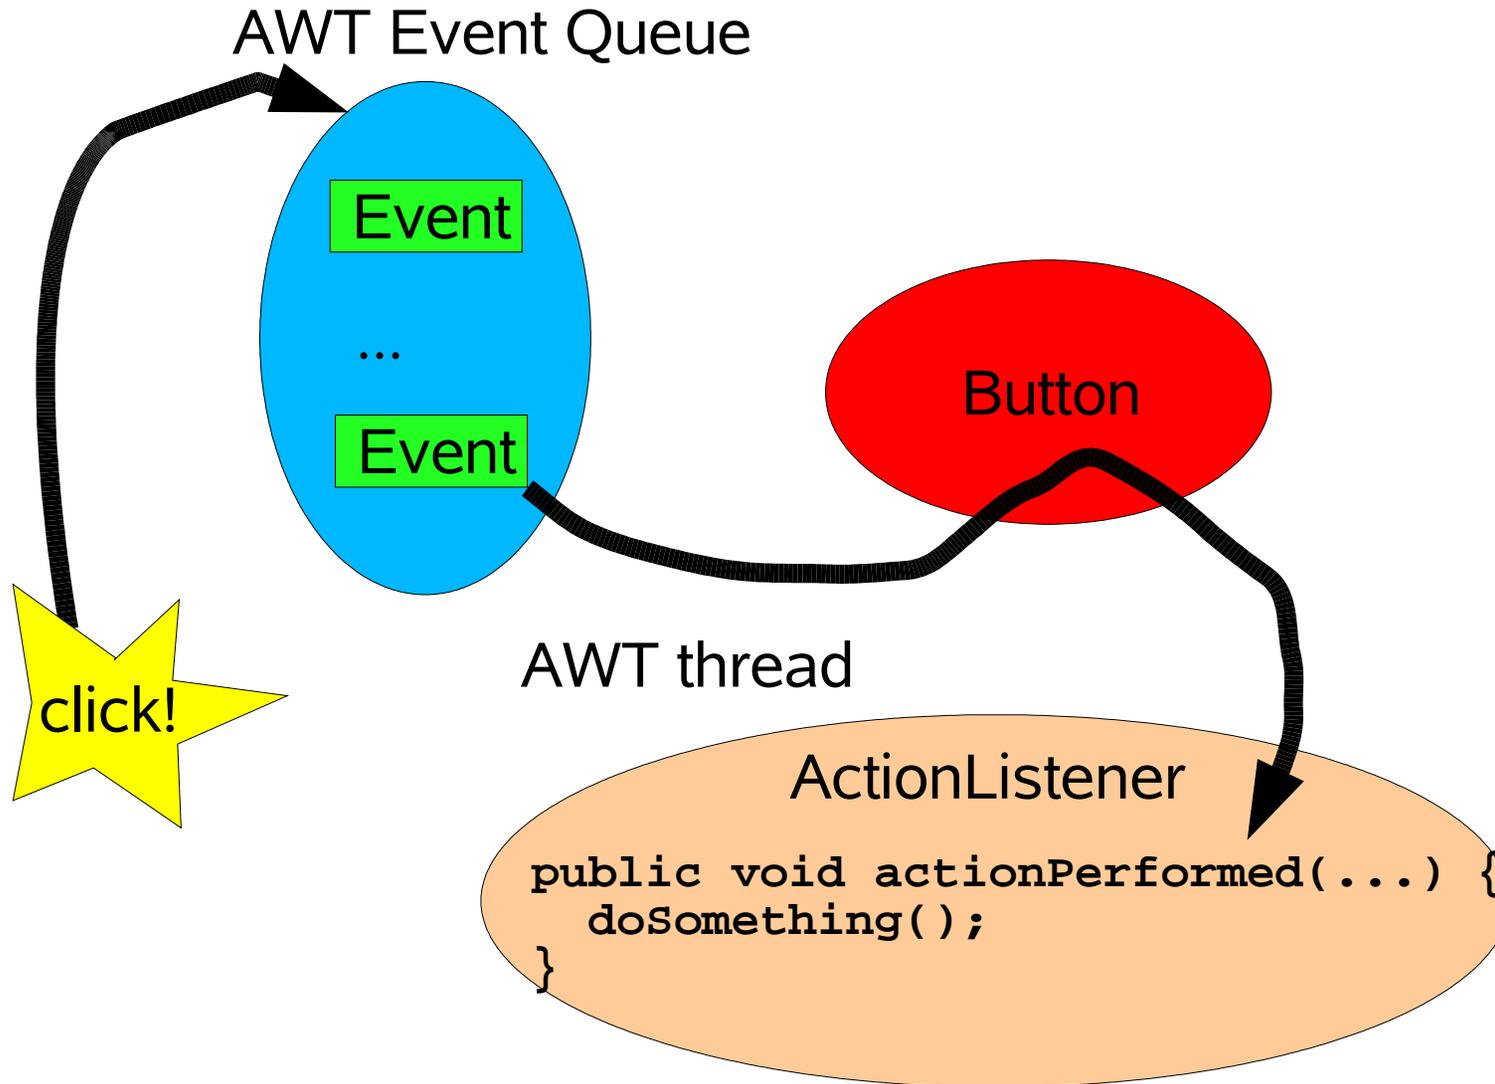

- Usually harder to program

Must break up into simple non-blocking actions

- Similar to GUI event-driven actions
- Cannot eliminate all blocking: GC, page faults, etc

Must keep track of logical state of service

# Background: Events in AWT

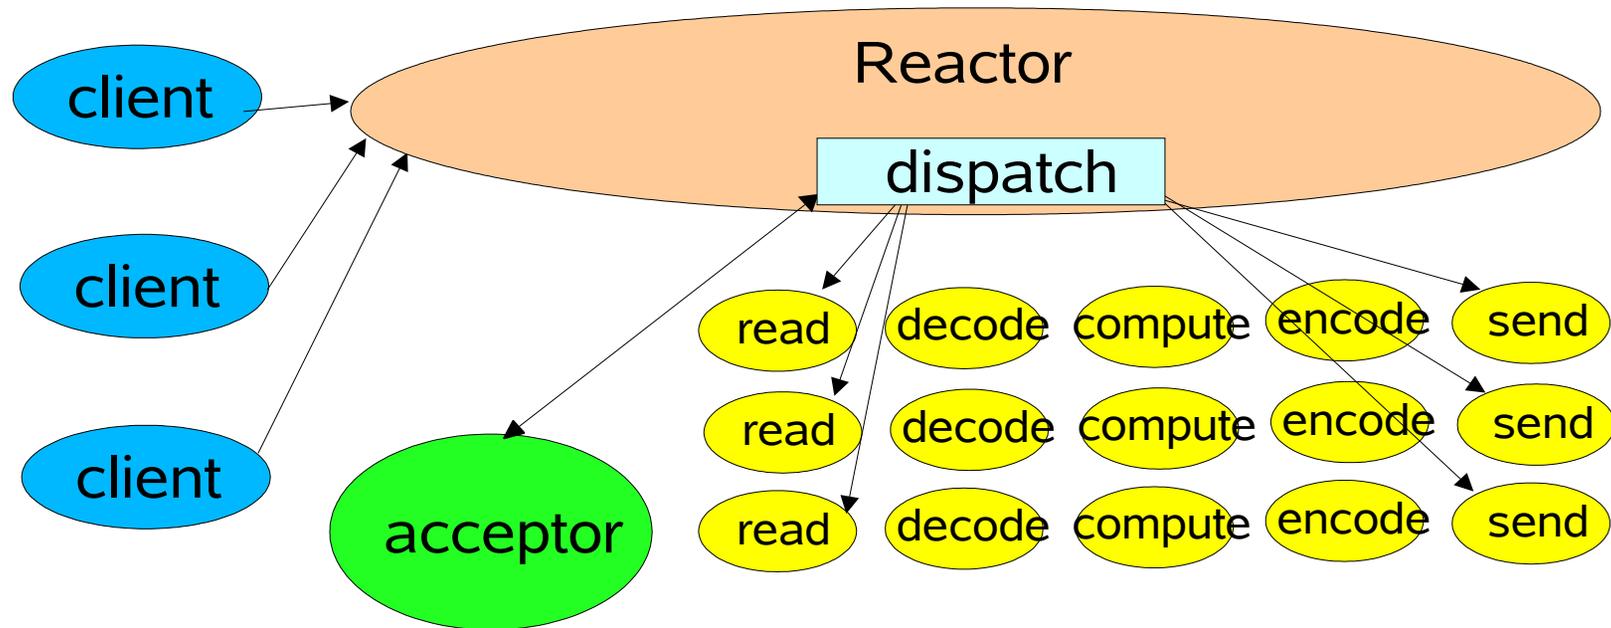

Event-driven IO uses similar ideas but in different designs

# Reactor Pattern

- " **Reactor** responds to IO events by dispatching the appropriate handler
  - Similar to AWT thread
- " **Handlers** perform non-blocking actions
  - Similar to AWT ActionListener
- " Manage by binding handlers to events
  - Similar to AWT addActionListener
- " See Schmidt et al, *Pattern-Oriented Software Architecture, Volume 2 (POSA2)*
  - Also Richard Stevens's networking books, Matt Welsh's SEDA framework, etc

# Basic Reactor Design

Single threaded version

# java.nio Support

- " **Channels**

  - Connections to files, sockets etc that support non-blocking reads

- " **Buffers**

  - Array-like objects that can be directly read or written by Channels

- " **Selectors**

  - Tell which of a set of Channels have IO events

- " **SelectionKeys**

  - Maintain IO event status and bindings

# Reactor 1: Setup

```
class Reactor implements Runnable {
    final Selector selector;
    final ServerSocketChannel serverSocket;

    Reactor(int port) throws IOException {
        selector = Selector.open();
        serverSocket = ServerSocketChannel.open();
        serverSocket.socket().bind(
            new InetSocketAddress(port));
        serverSocket.configureBlocking(false);
        SelectionKey sk =
            serverSocket.register(selector,
                SelectionKey.OP_ACCEPT);
        sk.attach(new Acceptor());
    }

    /*
     * Alternatively, use explicit SPI provider:
     * SelectorProvider p = SelectorProvider.provider();
     * selector = p.openSelector();
     * serverSocket = p.openServerSocketChannel();
     */
}
```

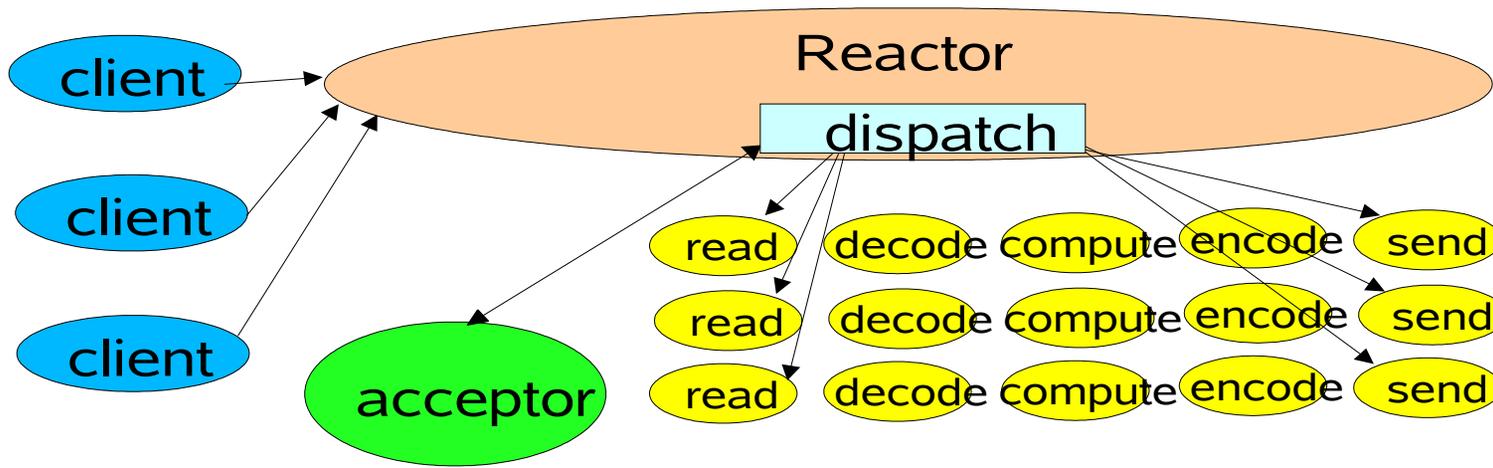

# Reactor 2: Dispatch Loop

```
// class Reactor continued
public void run() { // normally in a new
Thread
    try {
        while (!Thread.interrupted()) {
            selector.select();
            Set selected = selector.selectedKeys();
            Iterator it = selected.iterator();
            while (it.hasNext())
                dispatch((SelectionKey)(it.next()));
            selected.clear();
        }
    } catch (IOException ex) { /* ... */ }
}

void dispatch(SelectionKey k) {
    Runnable r = (Runnable)(k.attachment());
    if (r != null)
        r.run();
}
```

# Reactor 3: Acceptor

```
// class Reactor continued
class Acceptor implements Runnable { // inner
    public void run() {
        try {
            SocketChannel c = serverSocket.accept();
            if (c != null)
                new Handler(selector, c);
        }
        catch(IOException ex) { /* ... */ }
    }
}
```

# Reactor 4: Handler setup

```
final class Handler implements Runnable {
    final SocketChannel socket;
    final SelectionKey sk;
    ByteBuffer input = ByteBuffer.allocate(MAXIN);
    ByteBuffer output = ByteBuffer.allocate(MAXOUT);
    static final int READING = 0, SENDING = 1;
    int state = READING;
```

```
    Handler(Selector sel, SocketChannel c)
        throws IOException {
        socket = c; c.configureBlocking(false);
        // Optionally try first read now
        sk = socket.register(sel, 0);
        sk.attach(this);
        sk.interestOps(SelectionKey.OP_READ);
        sel.wakeup();
    }
```

```
    boolean inputIsComplete() { /* ... */ }
    boolean outputIsComplete() { /* ... */ }
    void process() { /* ... */ }
```

# Reactor 5: Request handling

```
// class Handler continued
public void run() {
    try {
        if (state == READING) read();
        else if (state == SENDING) send();
    } catch (IOException ex) { /* ... */ }
}
void read() throws IOException {
    socket.read(input);
    if (inputIsComplete()) {
        process();
        state = SENDING;
        // Normally also do first write now
        sk.interestOps(SelectionKey.OP_WRITE);
    }
}
void send() throws IOException {
    socket.write(output);
    if (outputIsComplete()) sk.cancel();
}
}
```

# Per-State Handlers

- " A simple use of GoF State-Object pattern  
**Rebind** appropriate handler as attachment

```
class Handler { // ...

    public void run() { // initial state is reader
        socket.read(input);
        if (inputIsComplete()) {
            process();
            sk.attach(new Sender());
            sk.interest(SelectionKey.OP_WRITE);
            sk.selector().wakeup();
        }
    }

    class Sender implements Runnable {
        public void run(){ // ...
            socket.write(output);
            if (outputIsComplete()) sk.cancel();
        }
    }
}
```

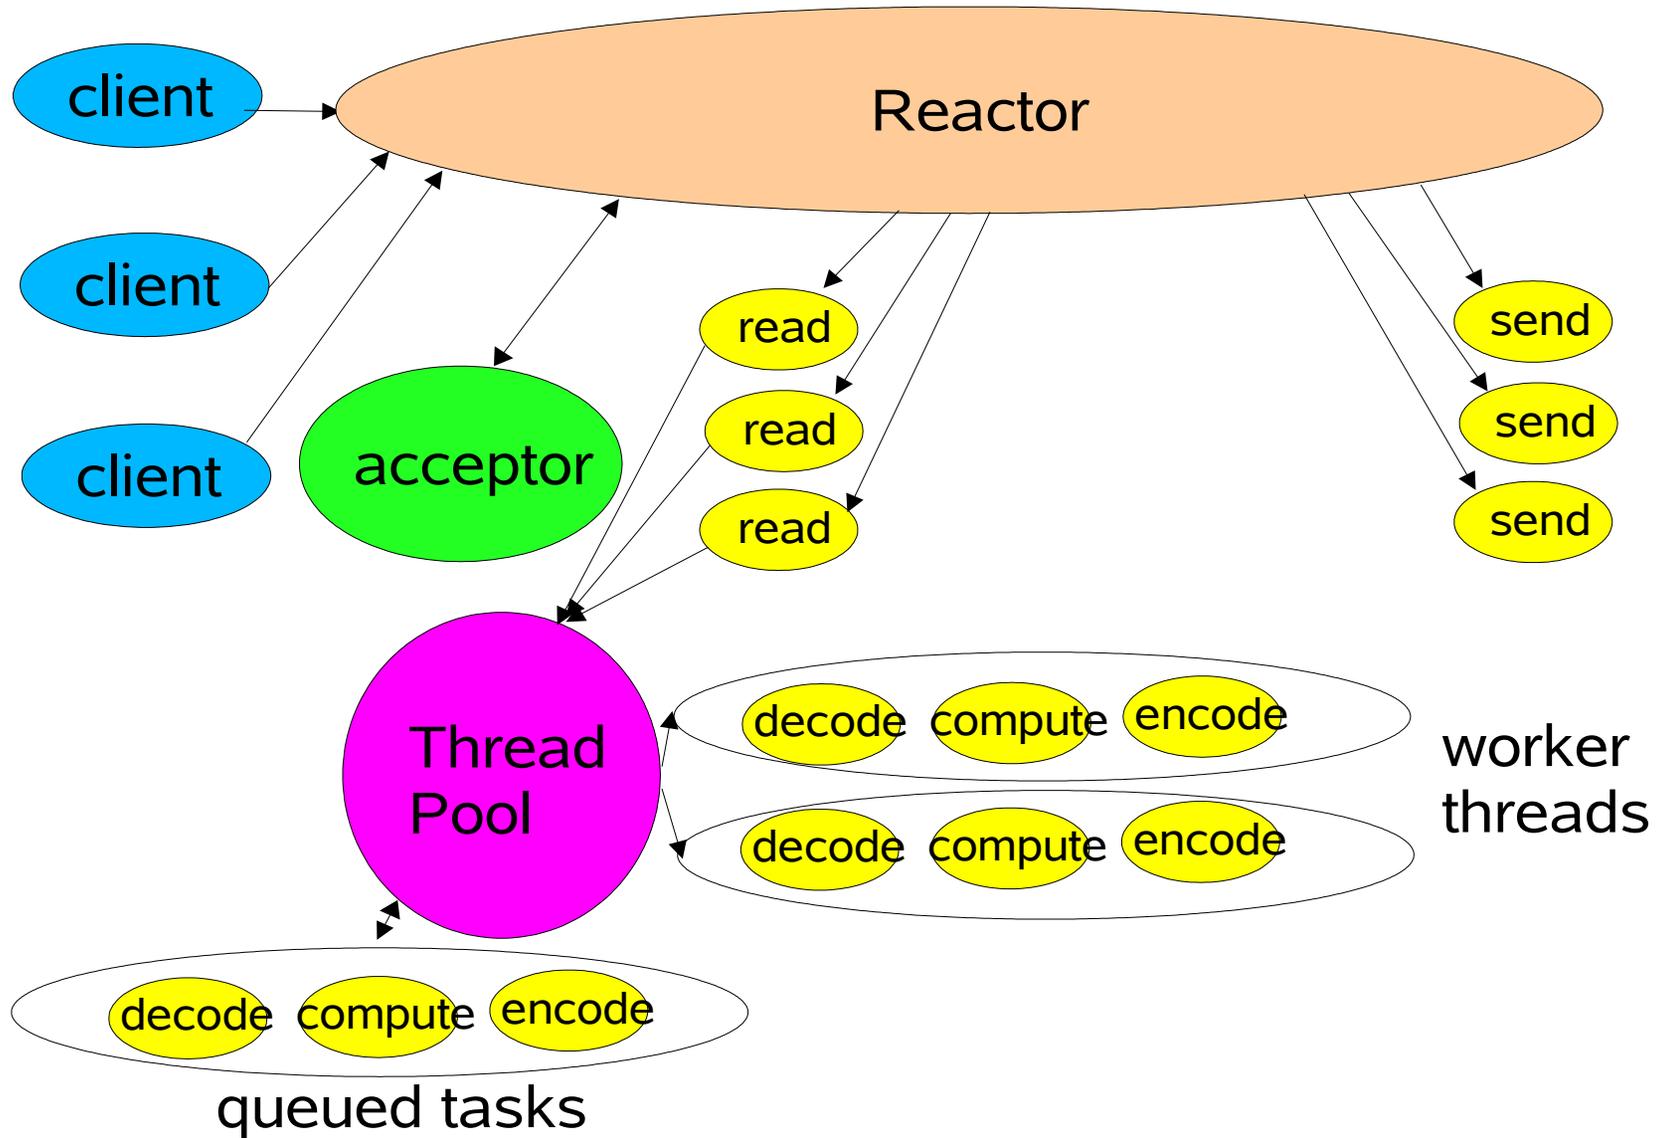

# Multithreaded Designs

- " Strategically add threads for scalability
  - Mainly applicable to multiprocessors
- " Worker Threads
  - Reactors should quickly trigger handlers
    - " Handler processing slows down Reactor
  - Offload non-IO processing to other threads
- " Multiple Reactor Threads
  - Reactor threads can saturate doing IO
  - Distribute load to other reactors
    - " Load-balance to match CPU and IO rates

# Worker Threads

- Offload non-IO processing to speed up Reactor thread
  - Similar to POA2 Proactor designs
- Simpler than reworking compute-bound processing into event-driven form
  - Should still be pure nonblocking computation
    - Enough processing to outweigh overhead
- But harder to overlap processing with IO
  - Best when can first read all input into a buffer
- Use thread pool so can tune and control
  - Normally need many fewer threads than clients

# Worker Thread Pools

# Handler with Thread Pool

```
class Handler implements Runnable {
    // uses util.concurrent thread pool
    static PooledExecutor pool = new PooledExecutor(...);
    static final int PROCESSING = 3;
    // ...

    synchronized void read() { // ...
        socket.read(input);
        if (inputIsComplete()) {
            state = PROCESSING;
            pool.execute(new Processer());
        }
    }

    synchronized void processAndHandOff() {
        process();
        state = SENDING; // or rebind attachment
        sk.interest(SelectionKey.OP_WRITE);
    }

    class Processer implements Runnable {
        public void run() { processAndHandOff(); }
    }
}
```

# Coordinating Tasks

- " **Handoffs**

  - Each task enables, triggers, or calls next one
  - Usually fastest but can be brittle

- " **Callbacks** to per-handler dispatcher

  - Sets state, attachment, etc

  - A variant of GoF Mediator pattern

- " **Queues**

  - For example, passing buffers across stages

- " **Futures**

  - When each task produces a result

  - Coordination layered on top of join or wait/notify

# Using PooledExecutor

- " A tunable worker thread pool
- " Main method **execute( Runnable r )**
- " Controls for:
  - The kind of task queue (any Channel)
  - Maximum number of threads
  - Minimum number of threads
  - "Warm" versus on-demand threads
  - Keep-alive interval until idle threads die
    - " to be later replaced by new ones if necessary
  - Saturation policy
    - " block, drop, producer-runs, etc

# Multiple Reactor Threads

## " Using Reactor Pools

Use to match CPU and IO rates

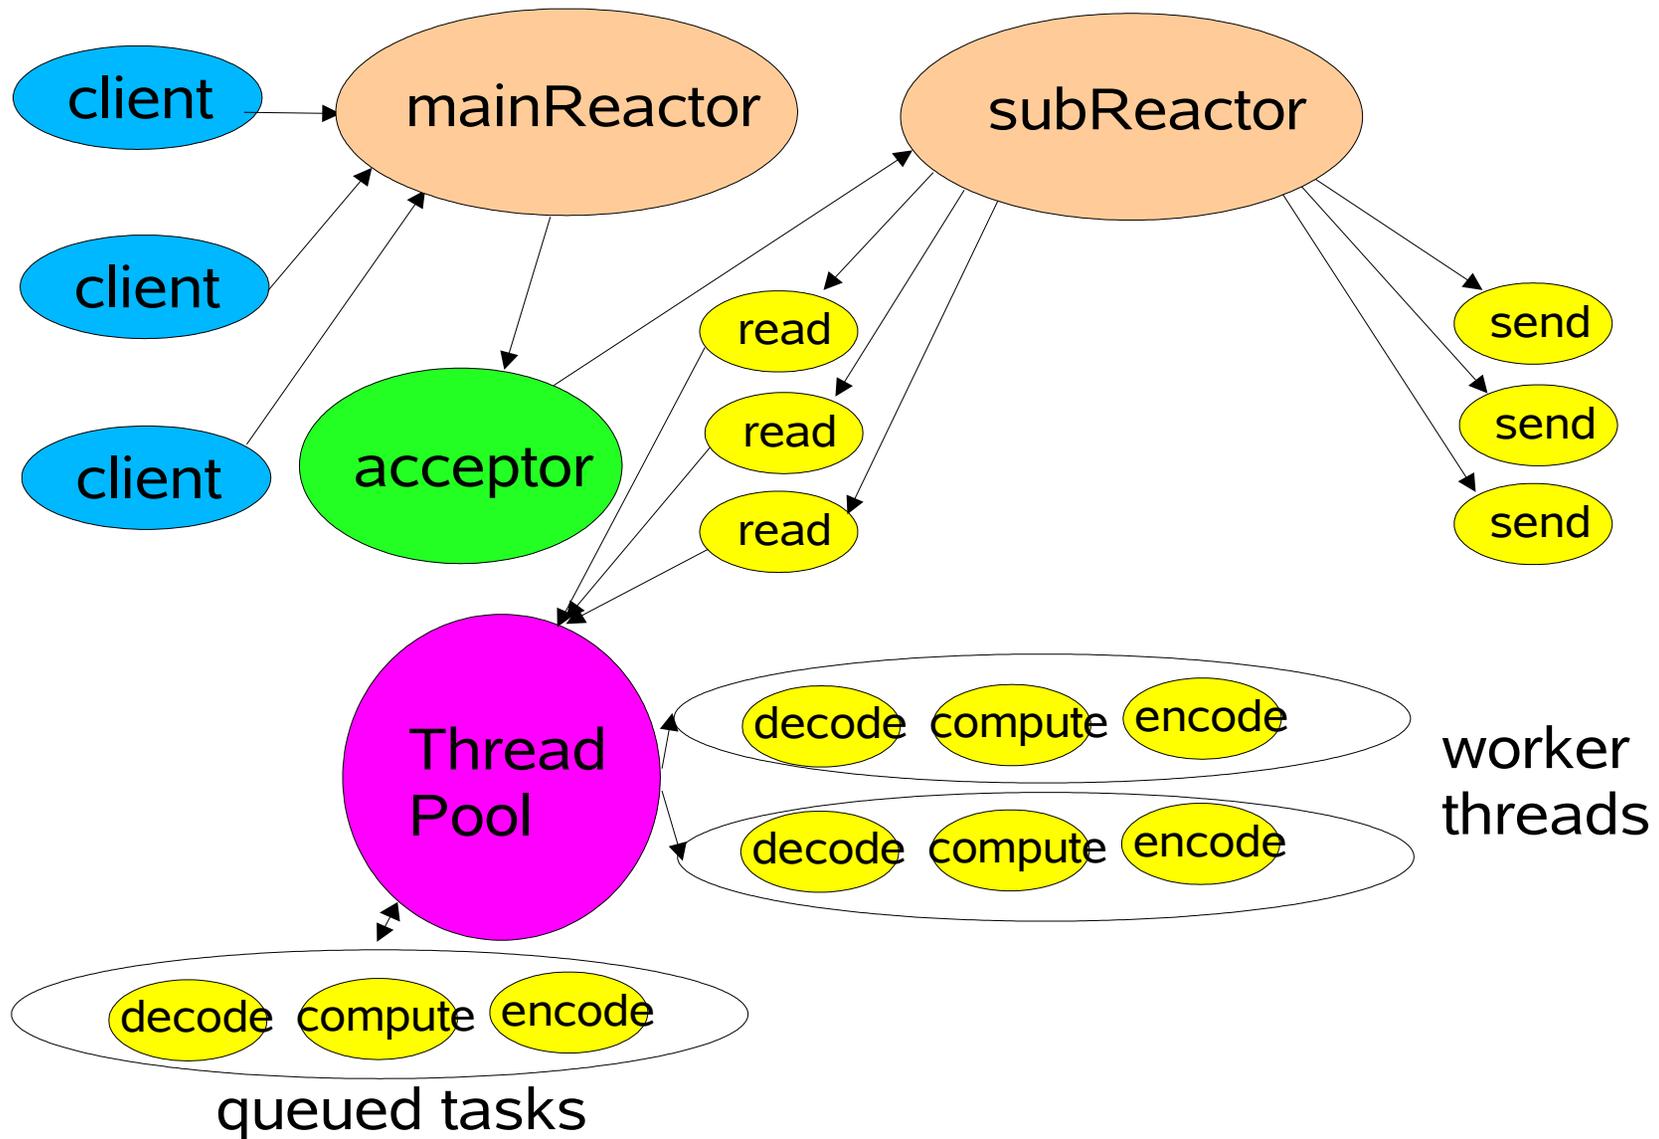

Static or dynamic construction

" Each with own Selector, Thread, dispatch loop

Main acceptor distributes to other reactors

```
Selector[] selectors; // also create threads
int next = 0;
class Acceptor { // ...
    public synchronized void run() { ...
        Socket connection = serverSocket.accept();
        if (connection != null)
            new Handler(selectors[next], connection);
        if (++next == selectors.length) next = 0;
    }
}
```

# Using Multiple Reactors

# Using other java.nio features

- " Multiple Selectors per Reactor
  - To bind different handlers to different IO events
  - May need careful synchronization to coordinate
- " File transfer
  - Automated file-to-net or net-to-file copying
- " Memory-mapped files
  - Access files via buffers
- " Direct buffers
  - Can sometimes achieve zero-copy transfer
  - But have setup and finalization overhead
  - Best for applications with long-lived connections

# Connection-Based Extensions

- " Instead of a single service request,
  - Client connects
  - Client sends a series of messages/requests
  - Client disconnects
- " Examples
  - Databases and Transaction monitors
  - Multi-participant games, chat, etc
- " Can extend basic network service patterns
  - Handle many relatively long-lived clients
  - Track client and session state (including drops)
  - Distribute services across multiple hosts

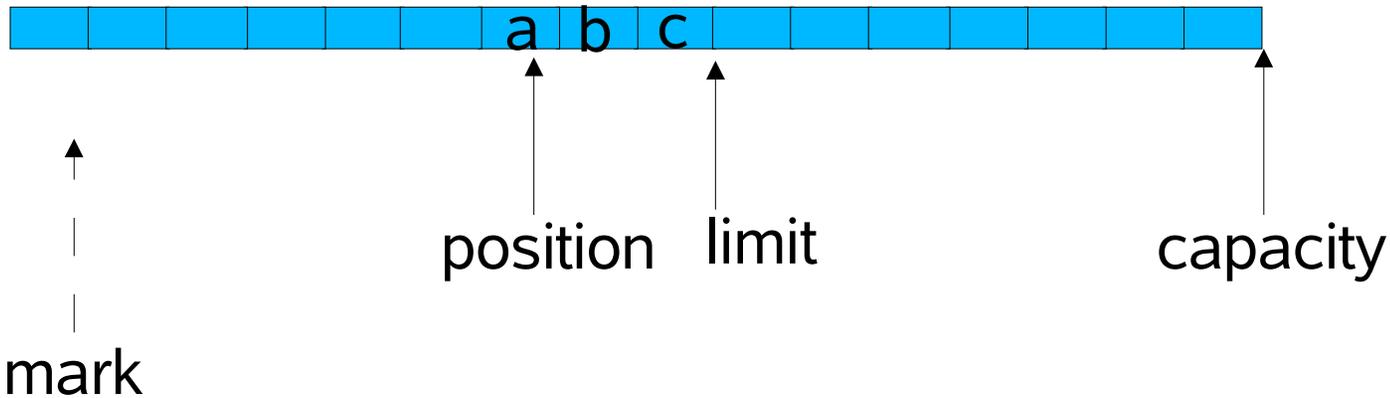

# API Walkthrough

---

- " Buffer
- " ByteBuffer
  - (CharBuffer, LongBuffer, etc not shown.)
- " Channel
- " SelectableChannel
- " SocketChannel
- " ServerSocketChannel
- " FileChannel
- " Selector
- " SelectionKey

# Buffer

```
abstract class Buffer {  
    int    capacity();  
    int    position();  
    Buffer position(int newPosition);  
    int    limit();  
    Buffer limit(int newLimit);  
    Buffer mark();  
    Buffer reset();  
    Buffer clear();  
    Buffer flip();  
    Buffer rewind();  
    int    remaining();  
    boolean hasRemaining();  
    boolean isReadOnly();  
}
```

# ByteBuffer (1)

```
abstract class ByteBuffer extends Buffer {  
    static ByteBuffer allocateDirect(int capacity);  
    static ByteBuffer allocate(int capacity);  
    static ByteBuffer wrap(byte[] src, int offset, int len);  
    static ByteBuffer wrap(byte[] src);
```

```
    boolean isDirect();  
    ByteOrder order();  
    ByteBuffer order(ByteOrder bo);  
    ByteBuffer slice();  
    ByteBuffer duplicate();  
    ByteBuffer compact();  
    ByteBuffer asReadOnlyBuffer();  
    byte get();  
    byte get(int index);  
    ByteBuffer get(byte[] dst, int offset, int length);  
    ByteBuffer get(byte[] dst);  
    ByteBuffer put(byte b);  
    ByteBuffer put(int index, byte b);  
    ByteBuffer put(byte[] src, int offset, int length);  
    ByteBuffer put(ByteBuffer src);  
    ByteBuffer put(byte[] src);  
    char getChar();  
    char getChar(int index);  
    ByteBuffer putChar(char value);  
    ByteBuffer putChar(int index, char value);  
    CharBuffer asCharBuffer();
```

# ByteBuffer (2)

```
short      getShort();
short      getShort(int index);
ByteBuffer putShort(short value);
ByteBuffer putShort(int index, short value);
ShortBuffer asShortBuffer();
int        getInt();
int        getInt(int index);
ByteBuffer putInt(int value);
ByteBuffer putInt(int index, int value);
IntBuffer  asIntBuffer();
long       getLong();
long       getLong(int index);
ByteBuffer putLong(long value);
ByteBuffer putLong(int index, long value);
LongBuffer asLongBuffer();
float      getFloat();
float      getFloat(int index);
ByteBuffer putFloat(float value);
ByteBuffer putFloat(int index, float value);
FloatBuffer asFloatBuffer();
double     getDouble();
double     getDouble(int index);
ByteBuffer putDouble(double value);
ByteBuffer putDouble(int index, double value);
DoubleBuffer asDoubleBuffer();
}
```

# Channel

```
interface Channel {
    boolean isOpen();
    void close() throws IOException;
}

interface ReadableByteChannel extends Channel {
    int read(ByteBuffer dst) throws IOException;
}

interface WritableByteChannel extends Channel {
    int write(ByteBuffer src) throws IOException;
}

interface ScatteringByteChannel extends ReadableByteChannel {
    int read(ByteBuffer[] dsts, int offset, int length)
        throws IOException;
    int read(ByteBuffer[] dsts) throws IOException;
}

interface GatheringByteChannel extends WritableByteChannel {
    int write(ByteBuffer[] srcs, int offset, int length)
        throws IOException;
    int write(ByteBuffer[] srcs) throws IOException;
}
```

# SelectableChannel

```
abstract class SelectableChannel implements Channel {
    int          validOps();
    boolean      isRegistered();

    SelectionKey keyFor(Selector sel);
    SelectionKey register(Selector sel, int ops)
        throws ClosedChannelException;

    void         configureBlocking(boolean block)
        throws IOException;

    boolean      isBlocking();
    Object       blockingLock();
}
```

# SocketChannel

```
abstract class SocketChannel implements ByteChannel ... {
    static SocketChannel open() throws IOException;

    Socket    socket();
    int       validOps();
    boolean   isConnected();
    boolean   isConnectionPending();
    boolean   isInputOpen();
    boolean   isOutputOpen();

    boolean   connect(SocketAddress remote) throws IOException;
    boolean   finishConnect() throws IOException;
    void      shutdownInput() throws IOException;
    void      shutdownOutput() throws IOException;

    int       read(ByteBuffer dst) throws IOException;
    int       read(ByteBuffer[] dsts, int offset, int length)
              throws IOException;
    int       read(ByteBuffer[] dsts) throws IOException;

    int       write(ByteBuffer src) throws IOException;
    int       write(ByteBuffer[] srcs, int offset, int length)
              throws IOException;
    int       write(ByteBuffer[] srcs) throws IOException;
}
```

# ServerSocketChannel

```
abstract class ServerSocketChannel extends ... {
    static ServerSocketChannel open() throws IOException;

    int          validOps();
    ServerSocket socket();
    SocketChannel accept() throws IOException;
}
```

# FileChannel

```
abstract class FileChannel implements ... {
    int  read(ByteBuffer dst);
    int  read(ByteBuffer dst, long position);
    int  read(ByteBuffer[] dsts, int offset, int length);
    int  read(ByteBuffer[] dsts);
    int  write(ByteBuffer src);
    int  write(ByteBuffer src, long position);
    int  write(ByteBuffer[] srcs, int offset, int length);
    int  write(ByteBuffer[] srcs);
    long position();
    void position(long newPosition);
    long size();
    void truncate(long size);
    void force(boolean flushMetadataToo);
    int  transferTo(long position, int count,
                   WritableByteChannel dst);
    int  transferFrom(ReadableByteChannel src,
                     long position, int count);
    FileLock lock(long position, long size, boolean shared);
    FileLock lock();
    FileLock tryLock(long pos, long size, boolean shared);
    FileLock tryLock();
    static final int MAP_RO, MAP_RW, MAP_COW;
    MappedByteBuffer map(int mode, long position, int size);
}
```

*NOTE: ALL methods throw IOException*

# Selector

```
abstract class Selector {
    static Selector open() throws IOException;
    Set keys();
    Set selectedKeys();
    int selectNow() throws IOException;
    int select(long timeout) throws IOException;
    int select() throws IOException;
    void wakeup();
    void close() throws IOException;
}
```

# SelectionKey

```
abstract class SelectionKey {
    static final int    OP_READ,      OP_WRITE,
                      OP_CONNECT, OP_ACCEPT;

    SelectableChannel channel();
    Selector          selector();
    boolean           isValid();
    void              cancel();
    int               interestOps();
    void              interestOps(int ops);
    int               readyOps();
    boolean           isReadable();
    boolean           isWritable();
    boolean           isConnectable();
    boolean           isAcceptable();
    Object            attach(Object ob);
    Object            attachment();
}
```
