

**Title:** Proposal to Encode the Tocharian Script  
**Author:** Lee Wilson (ttlwilson@hotmail.com)  
**Date:** 2015-10-09

## 1 Introduction

Tocharian is a Brahmi-based script historically used to write the Tocharian languages (ISO 639-3: xto, txb), traditionally referred to as Tocharian A and Tocharian B, which belong to the Tocharian branch of the Indo-European language family. The script was in use primarily during the 8th century CE by the people inhabiting the northern edge of the Tarim Basin of the Taklamakan Desert in what is now Xinjiang in western China, an area formerly known as Turkestan.

The Tocharian script is attested in over 4,000 extant manuscripts that were discovered in the early 20th century in the Tarim Basin. The discovery was significant for two reasons: first, it revealed a previously unknown branch of the Indo-European language family, and second, it marked the easternmost geographical extent of that language family.

The most distinctive aspect of Tocharian script is the vowel transcribed as *ä*, commonly known as the *Fremdvokal*, and the modifications to the script that it entails. This vowel is indicated with a vowel sign not employed in scripts outside of the Tarim Basin region. However, this vowel sign is not commonly used when writing Tocharian. Instead, sequences of a consonant followed by the *Fremdvokal* are most typically indicated by 11 CV signs known as *Fremdzeichen*, which are unique to Tocharian.

## 2 Background

The Tocharian script is a north-eastern descendant of Brahmi script, related to Khotanese, Tibetan, and Siddham scripts, which was used along the Tarim Basin in the Taklamakan Desert in what is now Xinjiang in western China.

Tocharian script was historically used to write the Tocharian languages (ISO 639-3: xto, txb), traditionally referred to as Tocharian A and Tocharian B, which belong to the Tocharian branch of the Indo-European language family. The script was in use primarily during the 8th century CE by the people inhabiting the northern edge of the Tarim Basin.

Tocharian script is attested in over 4,000 extant manuscripts that were discovered in the early 20th century in the Tarim Basin, primarily in Kucha, Karasahr, and Turfan.

## 3 The Issue of Representing Tocharian in Unicode

The primary issue facing any proposal to encode Tocharian in the UCS is that of unification with the Brahmi script. While it is true that many sources on Tocharian often refer to its script as “Tocharian Brahmi” or some similar appellation, the Tocharian script nevertheless presents several differences from Brahmi as laid out in the UCS in terms of glyph shapes, character repertoire, and rendering behaviours in particular. With this in mind, there are two main models for representing Tocharian in the UCS:

1. Encoding Tocharian as an independent script
2. Encoding Tocharian as a subset of Brahmi

### 3.1 Assessment of the Models for Representing Tocharian

Due to the traditional description of Tocharian script as a variant of Brahmi, their similar character repertoire, and the numerous Sanskrit loanwords found in Tocharian, some may argue that Tocharian is simply a regional variation of Brahmi and is accordingly a candidate for being encoded as a subset of Brahmi. In such a case, the distinctive elements of Tocharian would need to be managed at the presentation level through fonts and by encoding characters unique to Tocharian as Brahmi extensions. This approach poses problems, which are outlined below:

- *Failure to provide a plain text solution:* The Brahmi script as represented in the UCS is based on Aśokan Brahmi from the 3rd century BCE. The first and most obvious issue facing the encoding of Tocharian as a subset of Brahmi is the visual dissimilarity of Tocharian and Brahmi characters. Nearly all characters in Tocharian are considerably different from their Brahmi counterparts, as illustrated in the following selection of letters:

	a	ā	i	ī	u	ū	ka	kha	ga	gha	ña	śa	ṣa	sa	ha
Brahmi	𑀀	𑀁	𑀃	𑀄	𑀆	𑀇	𑀉	𑀊	𑀌	𑀍	𑀎	𑀏	𑀐	𑀑	𑀒
Tocharian	𑀅	𑀆	𑀇	𑀈	𑀉	𑀊	𑀋	𑀌	𑀍	𑀎	𑀏	𑀐	𑀑	𑀒	𑀓

Any reader of Brahmi-encoded Tocharian texts would be required to obtain a Brahmi font with character design based on Tocharian in order to read the texts, and would subsequently be unable to view Aśokan Brahmi texts properly. As a result, considering Tocharian as a subset of Brahmi fails to provide a means for plain text representation of the script.

- *Fundamental differences in structure:* Tocharian, while descended from Brahmi, employs several structural forms that are not used in Brahmi, such as stacked aksaras and the bar virama, which will be outlined below. As such, Tocharian script cannot be accurately rendered with Brahmi encoding.

Considering these problems, model 1, encoding Tocharian as an independent script, appears to be the best option.

## 4 Structure

### 4.1 Introduction

Tocharian script has typically been referred to as a modified form of Brahmi, indicating that people have traditionally considered this script simply to be a form of Brahmi. Although its structure and functionality is indeed clearly within the Brahmic tradition, the Tocharian script is nevertheless significantly different in a number of ways from the Aśokan Brahmi currently encoded, both in terms of glyph shape and orthographic conventions.

As is typical with Brahmic scripts, each letter indicates a consonant followed by the inherent vowel *a* by default. However, unlike scripts such as Devanagari, there is no visual element that is removed when a letter is used in a conjunct. The vowel is silenced either by a subscript conjunct or the *virāma*.

The most obviously different aspect of Tocharian is the use of eleven consonant signs, traditionally referred to as *Fremdzeichen*, which serve the dual function of representing a consonant plus the vowel *ä*, and to stand in place of the consonant plus virama (the deciding factor of use being the age of the manuscript; later manuscripts do not use *Fremdzeichen* alone to indicate consonant + virama).

Tocharian also employs unique compounding and virama usage which will be explained below.

### 4.2 Representative glyphs

The fonts used in this document were created by the author and are based on the documents preserved in the International Dunhuang Project.

### 4.3 Character Names

The characters are named in accordance with the UCS convention for Brahmi-based scripts, with the exception of the vowel AE and EI. The rationale for the spelling AE is that the *Fremdvokal* is traditionally transcribed *ä*, and *ae* is the typical replacement for *ä* in 7-bit ASCII contexts.

### 4.4 Directionality

The script is written from left to right.

### 4.5 Vowels

There are 13 independent vowel signs:

VOWEL LETTER A

VOWEL LETTER UU

VOWEL LETTER O

 VOWEL LETTER AA	 VOWEL LETTER VOCALIC R	 VOWEL LETTER AU
 VOWEL LETTER I	 VOWEL LETTER VOCALIC RR	 VOWEL LETTER AE
 VOWEL LETTER II	 VOWEL LETTER E	
 VOWEL LETTER U	 VOWEL LETTER AI	

The vowels VOCALIC L and VOCALIC LL are not attested in any Tocharian texts, but spaces have been left available in the code block in case of future discovery.

#### 4.6 Vowel Signs

There are 12 dependent vowel signs:

 VOWEL SIGN AA	 VOWEL SIGN UU	 VOWEL SIGN AI
 VOWEL SIGN I	 VOWEL SIGN VOCALIC R	 VOWEL SIGN O
 VOWEL SIGN II	 VOWEL SIGN VOCALIC RR	 VOWEL SIGN AU
 VOWEL SIGN U	 VOWEL SIGN E	 VOWEL SIGN AE

 VOWEL SIGN AE indicates the vowel /i/ (Krause and Slocum, 2014). The transcription <ä> is standard.

#### 4.7 Consonants

There are 44 consonant letters:

 KA	 TTA	 PA	 SSA	 WAE
 KHA	 TTHA	 PHA	 SA	 SHAE
 GA	 DDA	 BA	 HA	 SSAE
 GHA	 DDHA	 BHA	 BA	 SAE
 NGA	 NNA	 MA	 TAE	
 CA	 TA	 YA	 NAE	

 CHA	 THA	 RA	 PAE
 JA	 DA	 LA	 MAE
 JHA	 DHA	 VA	 RAE
 NYA	 NA	 SHA	 LAE

All letters bear the inherent vowel *a*. This vowel may be silenced with  VIRAMA or through the use of conjuncts, to be explained below.

Note that the default forms of the letters  TA and  NA are not consistently differentiated in Tocharian manuscripts. However, their combinations with certain vowels and subscript consonants remain distinct, requiring the letters to be encoded separately.

#### 4.8 Various signs

There are 4 various signs:

	ANUSVARA		VISARGA		JHVAMULIYA		UPADHMANIYA
---	----------	---	---------	---	------------	---	-------------

#### 4.9 Numbers

There are 20 numbers:

	ONE		SIX		TWENTY		SEVENTY
	TWO		SEVEN		THIRTY		EIGHTY
	THREE		EIGHT		FORTY		NINETY
	FOUR		NINE		FIFTY		ONE HUNDRED
	FIVE		TEN		SIXTY		ONE THOUSAND

Numbers for “two hundred” and “three hundred” also exist, but they are transparent combinations of the digit for one hundred and the digits for multiples of one. Numbers beyond 300 are written in horizontal sequences, e.g.  400.

In numbers 11, 21, etc., the number  ONE always stacks vertically, appearing above of the previous number, e.g.  91. This only occurs with ONE, all other numbers being formed horizontally, e.g.  92,  43,  24, etc.

The numbers 200, 300, and 11, 21, through 91 require special encoding to allow for the modifications above described. There are a number of potential solutions. The first is to encode each one separately, but this seems unnecessary, as they can readily be created through glyph combination. The second option is to employ the virama to merge the letters, but as this solution was proposed and rejected for Brahmi, it is best avoided. The solution is to use a dedicated number joiner. As Brahmi already has a number joiner for this purpose, it could be employed, but perhaps a script-specific number joiner may be the better option. This number joiner would, however, only be used for a total of 11 joined numbers (11, 21, 31, 41, 51, 61, 71, 81, 91, 200, 300), so it may not be useful enough to warrant incorporation as a separate character.

#### 4.10 Vowel signs (matras)

Each vowel letter has a corresponding vowel sign. Vowel signs can be found above, below, or to the right of the consonant letter. Vowel signs that appear below the letter often initiate

changes in the vowel sign, the consonant letter, or both. The vowel signs 𐰽 AA, 𐰺 U, and 𐰻 UU also takes on several contextual forms, and the consonant letter 𐰽 LA takes on irregular forms.

#### 4.10.1 Contextual forms of vowel signs

AA The vowel sign 𐰽 AA has various contextual forms, outlined below:

1 When combined with open-topped consonants and certain others:

𐰽	ghā	(𐰽 GHA, vowel sign 𐰽 AA)
𐰽	ñā	(𐰽 NYA, vowel sign 𐰽 AA)
𐰽	pā	(𐰽 NYA, vowel sign 𐰽 AA)
𐰽	phā	(𐰽 NYA, vowel sign 𐰽 AA)
𐰽	mā	(𐰽 NYA, vowel sign 𐰽 AA)
𐰽	yā	(𐰽 YA, vowel sign 𐰽 AA)
𐰽	ṣā	(𐰽 YA, vowel sign 𐰽 AA)
𐰽	sā	(𐰽 YA, vowel sign 𐰽 AA)
𐰽	hā	(𐰽 YA, vowel sign 𐰽 AA)

2 A smaller variant occurs with certain round-topped letters:

𐰽	khā	(𐰽 KHA, vowel sign 𐰽 AA)
𐰽	gā	(𐰽 GA, vowel sign 𐰽 AA)
𐰽	dhā	(𐰽 DHA, vowel sign 𐰽 AA)
𐰽	śā	(𐰽 SHA, vowel sign 𐰽 AA)

3. A tall superscript form also appears with certain letters:

𐰽	ñā	(𐰽 NGA, vowel sign 𐰽 AA)
𐰽	jā	(𐰽 JA, vowel sign 𐰽 AA)
𐰽	ṭā	(𐰽 TTA, vowel sign 𐰽 AA)
𐰽	ṇā	(𐰽 NNA, vowel sign 𐰽 AA)

U/UU The vowel signs 𐰺 U and 𐰻 UU have three contextual variations, outlined below:

1. They both take a distinct form on letters that already have descenders that resemble ീ U.  
This form also appears on ു DA:

𑖄	<i>ku</i>	(𑖄 KA, vowel sign ീ U)
𑖅	<i>jhu</i>	(𑖅 JHA, vowel sign ീ U)
𑖆	<i>ḍu</i>	(𑖆 DDA, vowel sign ീ U)
𑖇	<i>du</i>	(𑖇 DA, vowel sign ീ U)
𑖈	<i>ru</i>	(𑖈 RA, vowel sign ീ U)
𑖉	<i>kū</i>	(𑖉 KA, vowel sign ു UU)
𑖊	<i>jhū</i>	(𑖊 JHA, vowel sign ു UU)
𑖋	<i>ḍū</i>	(𑖋 DDA, vowel sign ു UU)
𑖌	<i>dū</i>	(𑖌 DA, vowel sign ു UU)
𑖍	<i>rū</i>	(𑖍 RA, vowel sign ു UU)

2. The second form is similar to the first, and only occurs with subscript ീ RA:

𑖎	<i>pra</i>	(𑖎 PA, ീ RA)
𑖏	<i>pru</i>	(𑖏 PA, ീ RA, vowel sign ീ U)
𑖐	<i>prū</i>	(𑖐 PA, ീ RA, vowel sign ു UU)

3. Forms superficially resembling the independent vowels ീ O and ു AU appear in combination with certain letters:

𑖑	<i>tu</i>	(𑖑 TA, vowel sign ീ U)
𑖒	<i>bhu</i>	(𑖒 BHA, vowel sign ീ U)
𑖓	<i>gu</i>	(𑖓 GA, vowel sign ീ U)
𑖔	<i>śu</i>	(𑖔 SHA, vowel sign ീ U)
𑖕	<i>tū</i>	(𑖕 TA, vowel sign ു UU)
𑖖	<i>bhū</i>	(𑖖 BHA, vowel sign ു UU)
𑖗	<i>gū</i>	(𑖗 GA, vowel sign ു UU)
𑖘	<i>śū</i>	(𑖘 SHA, vowel sign ു UU)

VOCALIC R AND RR Similar to the vowels U and UU, when these signs attach to a

consonant with a descender, it is deleted:

	<i>kṛ</i>	( KA, vowel sign  VOCALIC R)
	<i>jhṛ</i>	( JHA, vowel sign  VOCALIC R)
	<i>dṛ</i>	( DDA, vowel sign  VOCALIC R)
	<i>kṝ</i>	( KA, vowel sign  VOCALIC RR)
	<i>jhṝ</i>	( JHA, vowel sign  VOCALIC RR)
	<i>dṝ</i>	( DDA, vowel sign  VOCALIC RR)

Note that these do not occur with RA.

They also cause minor variation in the forms of NA. and BHA:

	<i>nṛ</i>	( NA, vowel sign  VOCALIC R)
	<i>bhṛ</i>	( BHA, vowel sign  VOCALIC R)
	<i>nṝ</i>	( NA, vowel sign  VOCALIC RR)
	<i>bhṝ</i>	( BHA, vowel sign  VOCALIC RR)

LA The consonant letter LA induces a number of irregular vowel sign forms:

	<i>li</i>	( LA, vowel sign  I)
	<i>lī</i>	( LA, vowel sign  II)
	<i>le</i>	( LA, vowel sign  E)
	<i>lai</i>	( LA, vowel sign  AI)
	<i>lo</i>	( LA, vowel sign  O)
	<i>lau</i>	( LA, vowel sign  AU)

I/II/E/AI/O/AU On open topped letters, these vowel signs appear one ascender to the left of the right ascender. In the case of AI, the two elements of the vowel sign appear on different ascenders. Examples:

	<i>ghi</i>	( GHA, vowel sign ) I)
	<i>pī</i>	( PA, vowel sign ) II)
	<i>hī</i>	( HA, vowel sign ) II)
	<i>se</i>	( SA, vowel sign ) E)
	<i>mai</i>	( MA, vowel sign ) AI)
	<i>ṣo</i>	( SSA, vowel sign ) O)
	<i>pau</i>	( PHA, vowel sign ) AU)

#### 4.11 Conjuncts

Subscripts are employed to indicate consonant clusters. Most subscripts are relatively transparent and easily identifiable. There are nevertheless some subscripts that differ to a greater or lesser degree from their base forms.

Conjuncts typically comprise between 2 and 4 consonant letters, though there is theoretically no limit:

	<i>jña</i>	( JA,  NYA)
	<i>kṣtsa</i>	( KA,  SSA,  TA,  SA)

##### 4.11.1 Variation in subscript glyph shapes

YA and RA form subscripts that are entirely dissimilar to their base forms, while VA is also slightly different:

	<i>pya</i>	( PA,  YA)
	<i>pra</i>	( PA,  RA)
	<i>pva</i>	( PA,  VA)

Several other letters gain a supporting bar in subscript form by which they attach to the base letter:

	<i>dga</i>	( DA,  GA)
	<i>ṣṭha</i>	( SSA,  TTHA)
	<i>ddha</i>	( DA,  DHA)
	<i>nthā</i>	( NA,  THA)
	<i>wśa</i>	( WAE,  SHA)

All subscripts with head-like serif element lose it in subscript form:

 <i>lla</i>	(  LA,  LA)
 <i>csa</i>	(  CA,  SA)
 <i>kma</i>	(  KA,  MA)
 <i>lta</i>	(  LA,  TA)

The position of subscripts in relation to the base consonants to which they attach is entirely dependent on the specific characters involved. Every base and subscript form has an invariable connection point used in the formation of conjuncts. As a result, some subscripts appear directly below the base, while others appear partially or almost fully to the right:

 <i>s̥tha</i>	(  SSA,  TTHA)
 <i>kma</i>	(  KA,  MA)
 <i>sya</i>	(  SA,  YA)
 <i>csa</i>	(  CA,  SA)

This invariable positioning has consequences for subscript  YA, as it typically extends somewhat above the base of the glyph to which it is attached. When the location of the connection point of the base glyph makes this impossible, the height of subscript YA is truncated. Compare its length and height in the following conjuncts:

 <i>sya</i>	(  SA,  YA)
 <i>kya</i>	(  KA,  YA)

The conjunct *kka* employs an abbreviated form of the subscript:

 <i>kka</i>	(  KA,  KA)
--	---

Tocharian has one letter,  *tsa*, which appears frequently and could also be classified as an akhand. It is noteworthy that in this particular conjunct,  TA has a combining form resembling that of  NA. This likely arises from  *tsa* appearing frequently, and NA having the simpler combining form (see 4.11.2 for discussion of the subscript forms of TA and NA).

#### 4.11.2 Variation in base glyph shapes

Conjuncts can also initiate changes in the form of the base consonant. This is most noticeable in the base conjunct forms of consonant letters with descenders. Just as they lose their

descenders when combining with subscript vowel signs, so do they lose them in consonant conjuncts, e.g.:

	<i>kla</i>	(  KA,  LA)
	<i>dva</i>	(  DDA,  VA)

This also occurs with the letter  RA, but with an important difference: namely, that it acts as a typical repha. The form of RA appears above the writing line and attaches to the full base form of a letter:

	<i>rha</i>	(  RA,  HA)
	<i>rna</i>	(  RA,  NNA)

All vowel signs aside from those that attach to the bottom of consonants must attach to the repha:

	<i>rgo</i>	(  RA,  GA, vowel sign  O)
	<i>rnā</i>	(  RA,  NA, vowel sign  AA)

The letter  LA has an irregular form when it combines with repha RA:

	<i>rla</i>	(  RA,  LA)
---	------------	---

Repha does not occur with  YA; instead, a regular conjunct is formed:

	<i>rya</i>	(  RA,  YA)
---	------------	---

The letters  TA and  NA have unique alterations in shape. The alteration in the base form can differentiate the two letters:

	<i>twa</i>	(  TA,  WAE)
	<i>nwa</i>	(  NA,  WAE)

This is not always a reliable guide, however, as TA occasionally resembles the combining form of NA:

 tsa      ( TA,  SA)

As mentioned in 4.11.10, this may best be handled as an akhand ligature.

### 4.11.3 Aksara conjuncts

Unusually, two consonant signs, each bearing its own a vowel sign, can be combined into a single conjunct. This is most commonly found with the sequence *ku*, which represents the Tocharian consonant /k<sup>w</sup>/, but it also occurs for metrical rather than phonological reasons (Hitch 2012: 282) (see Figure 4 i, j, k). Examples:

 ku      ( KA, vowel sign  U)

 ce      ( CA, vowel sign  E)

 küice

 wi      ( WAE, vowel sign  I)

 nā      ( NA, vowel sign  AA)

 winā

As can be seen, the vowel sign from the subscripted aksara is moved to a more convenient location.

### 4.12 Virama

There is 1 virama:

 VIRAMA

Tocharian employs a form of the virama that functions exactly as viramas in other Indic scripts. However, it also employs a second, far more commonly-occurring form of virama that appears visually as a horizontal or diagonal bar that precedes the marked letter or conjunct and connects it with the preceding, vowel-bearing letter or conjunct. The distinction between the two virama is mostly context-based, as, typically, *Fremdzeichen* take the bar virama while standard letters take the standard virama, though there are some exceptions (see Figure 4).

Example:

𑖄𑖅 *śal* (𑖄 SHA, 𑖅 LAE, ̣ VIRAMA)

This also occurs with final consonant clusters that include a *Fremdzeichen*:

𑖄𑖅𑖆 *lkānt* (𑖄 LA, ̣ VIRAMA, 𑖆 KA 𑖆 NA, ̣ VIRAMA, 𑖆 TAE, ̣ VIRAMA)

It is important to note that the bar virama can attach to any portion of the previous aksara, including the base consonant, subscript, or vowel sign.

Occasionally, a consonant may bear a redundant standard virama in addition to the bar virama:

𑖄𑖅𑖆 *mor* (𑖄 MA, vowel sign ̣ O, 𑖆 RAE, ̣ VIRAMA, ̣ VIRAMA)

This is, however, optional; the redundant standard virama is typically absent.

The bar virama should be treated as an alternate form of the standard virama. Though it appears before the letter it modifies, this is common in Brahmic scripts (cf. vowel signs in Devanagari, Thai, etc.). Bar virama is the standard form used with *Fremdzeichen*, while the standard virama appears on regular consonants. The exception to this are the letters 𑖆 CA and 𑖅 NYA, which lack *Fremdzeichen* variants.

𑖅𑖆 *teñ* (𑖅 TA, 𑖆 NYA, ̣ VIRAMA)

Occasionally, the vowel sign ̣ AE will appear on a letter carrying a bar virama:

𑖄𑖅𑖆 *picä* (𑖄 PA, vowel sign ̣ I, 𑖆 CA, ̣ VIRAMA, vowel sign ̣ AE)

This is largely restricted to 𑖆 CA and 𑖅 NYA, but does occur on some other letters as well:

𑖆𑖅𑖆 *koyä* (𑖆 KA, vowel sign ̣ O, 𑖅 YA, ̣ VIRAMA, vowel sign ̣ AE)

The proposed implementation is:

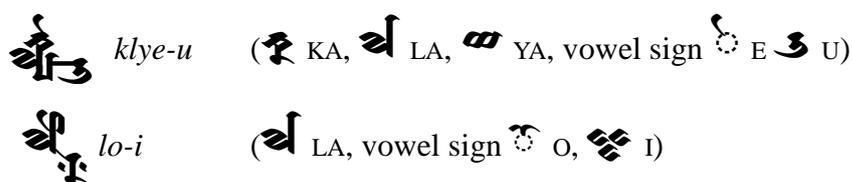

- *Fremdzeichen* with virama: virama is realized as bar virama
- *Fremdzeichen* with two viramas: first virama is realized as bar virama, second as standard virama

- standard consonant with virama: virama is realized as standard virama
- standard consonant with virama and vowel sign ◌̣: AE: virama is realized as bar virama.

#### 4.13 Subscript Independent Vowel Letters

In distinct contrast to most Brahmic scripts (but with precedent in e.g. Khmer), Tocharian indicates some diphthongs through the use of subscript independent vowel signs, which are also necessarily marked with virama (see Figure 7 e, f, g, h).

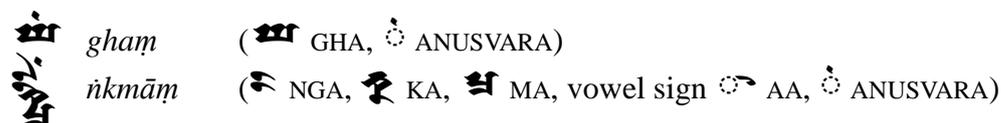

If the base letter has a subscript, the virama is straight and attaches to the subscript. If it does not, the virama angles up to attach to the base consonant. Examples:

  
 klye-u (𑖅 KA, 𑖆 LA, 𑖇 YA, vowel sign ◌̣ E 𑖉 U)
   
 lo-i (𑖆 LA, vowel sign ◌̣ O, 𑖊 I)

Notice that the subscript 𑖊 I takes a different form.

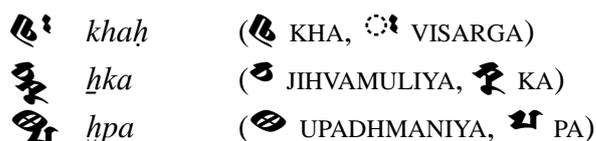

#### 4.14 Nasalization

The languages do not have nasalization *per se*, but the script nevertheless employ *anusvāra* both for nasal consonants and for transcription of Sanskrit nasalization. It appears immediately above the base consonant letter.

  
 gham (𑖛 GHA, ◌̣ ANUSVARA)
   
 ñkmām (𑖛 NGA, 𑖅 KA, 𑖛 MA, vowel sign ◌̣ AA, ◌̣ ANUSVARA)

#### 4.15 Aspiration

Tocharian employs three signs for aspiration: the *visarga* sign, which appears to the right of the base consonant sign, and the *jihvāmūliya* and *upadhmaniya*, which respectively indicate velar and labial allophones of *h*. These differ from visarga in that they act as letters and form conjuncts with the preceding consonant letter.

  
 khaḥ (𑖅 KHA, ◌̣ VISARGA)
   
 ḥka (𑖛 JHIVAMULIYA, 𑖅 KA)
   
 ḥpa (𑖛 UPADHMANIYA, 𑖛 PA)

In Tocharian texts, VISARGA is relatively common, but JHIVAMULIYA and UPADHMANIYA are exceedingly rare.

#### **4.16 Punctuation**

There are four punctuation marks:

**I**      DANDA

**II**     DOUBLE DANDA

•        PUNCTUATION DOT

••      PUNCTUATION DOUBLE DOT

## 5 Character data

### 5.1 Character Properties

Tocharian character properties are as follows:

```

11E00;TOCHARIAN LETTER A;Lo;0;L;;;;N;;;;;
11E01;TOCHARIAN LETTER AA;Lo;0;L;;;;N;;;;;
11E02;TOCHARIAN LETTER I;Lo;0;L;;;;N;;;;;

**ISO/IEC JTC 1/SC 2/WG 2**  
**PROPOSAL SUMMARY FORM TO ACCOMPANY SUBMISSIONS**  
**FOR ADDITIONS TO THE REPERTOIRE OF ISO/IEC 10646<sup>1</sup>.**  
**Please fill all the sections A, B and C below.**  
**Please read Principles and Procedures Document (P & P) from <http://std.dkuug.dk/JTC1/SC2/WG2/docs/principles.html> for guidelines and details before filling this form.**  
**Please ensure you are using the latest Form from <http://std.dkuug.dk/JTC1/SC2/WG2/docs/summaryform.html>.**  
**See also <http://std.dkuug.dk/JTC1/SC2/WG2/docs/roadmaps.html> for latest Roadmaps.**

**A. Administrative**

1. **Title:** *Preliminary Proposal to Encode the Tocharian Script*

2. Requester's name: *Lee Wilson (ttlwilson@hotmail.com)*

3. Requester type (Member body/Liaison/Individual contribution): *Individual contribution*

4. Submission date: *2014-10-09*

5. Requester's reference (if applicable):

6. Choose one of the following:  
 This is a complete proposal:  *yes*  
 (or) More information will be provided later:

**B. Technical – General**

1. Choose one of the following:  
 a. This proposal is for a new script (set of characters):  *yes*  
 Proposed name of script: *Tocharian*  
 b. The proposal is for addition of character(s) to an existing block:  
 Name of the existing block:

2. Number of characters in proposal: *97*

3. Proposed category (select one from below - see section 2.2 of P&P document):  
 A-Contemporary  B.1-Specialized (small collection)  B.2-Specialized (large collection)   
 C-Major extinct  D-Attested extinct  E-Minor extinct   
 F-Archaic Hieroglyphic or Ideographic  G-Obscure or questionable usage symbols

4. Is a repertoire including character names provided?  *Yes*  
 a. If YES, are the names in accordance with the “character naming guidelines” in Annex L of P&P document?  *Yes*  
 b. Are the character shapes attached in a legible form suitable for review?  *Yes*

5. Fonts related:  
 a. Who will provide the appropriate computerized font to the Project Editor of 10646 for publishing the standard?  
*Lee Wilson (TrueType or OpenType format)*  
 b. Identify the party granting a license for use of the font by the editors (include address, e-mail, ftp-site, etc.):  
*Lee Wilson (ttlwilson@hotmail.com)*

6. References:  
 a. Are references (to other character sets, dictionaries, descriptive texts etc.) provided?  *Yes*  
 b. Are published examples of use (such as samples from newspapers, magazines, or other sources) of proposed characters attached?  *No*

7. Special encoding issues:  
 Does the proposal address other aspects of character data processing (if applicable) such as input, presentation, sorting, searching, indexing, transliteration etc. (if yes please enclose information)?  *No*

**8. Additional Information:**

Submitters are invited to provide any additional information about Properties of the proposed Character(s) or Script that will assist in correct understanding of and correct linguistic processing of the proposed character(s) or script. Examples of such properties are: Casing information, Numeric information, Currency information, Display behaviour information such as line breaks, widths etc., Combining behaviour, Spacing behaviour, Directional behaviour, Default Collation behaviour, relevance in Mark Up contexts, Compatibility equivalence and other Unicode normalization related information. See the Unicode standard at <http://www.unicode.org> for such information on other scripts. Also see Unicode Character Database ( <http://www.unicode.org/reports/tr44/> ) and associated Unicode Technical Reports for information needed for consideration by the Unicode Technical Committee for inclusion in the Unicode Standard.

<sup>1</sup> Form number: N4502-F (Original 1994-10-14; Revised 1995-01, 1995-04, 1996-04, 1996-08, 1999-03, 2001-05, 2001-09, 2003-11, 2005-01, 2005-09, 2005-10, 2007-03, 2008-05, 2009-11, 2011-03, 2012-01)

**C. Technical - Justification**

1. Has this proposal for addition of character(s) been submitted before? If YES explain	<i>No</i>
2. Has contact been made to members of the user community (for example: National Body, user groups of the script or characters, other experts, etc.)? If YES, with whom? If YES, available relevant documents:	<i>n/a</i>
3. Information on the user community for the proposed characters (for example: size, demographics, information technology use, or publishing use) is included? Reference:	<i>extinct</i>
4. The context of use for the proposed characters (type of use; common or rare) Reference:	<i>rare</i>
5. Are the proposed characters in current use by the user community? If YES, where? Reference:	<i>No</i>
6. After giving due considerations to the principles in the P&P document must the proposed characters be entirely in the BMP? If YES, is a rationale provided? If YES, reference:	
7. Should the proposed characters be kept together in a contiguous range (rather than being scattered)?	<i>Yes</i>
8. Can any of the proposed characters be considered a presentation form of an existing character or character sequence? If YES, is a rationale for its inclusion provided? If YES, reference:	<i>No</i>
9. Can any of the proposed characters be encoded using a composed character sequence of either existing characters or other proposed characters? If YES, is a rationale for its inclusion provided? If YES, reference:	<i>No</i>
10. Can any of the proposed character(s) be considered to be similar (in appearance or function) to, or could be confused with, an existing character? If YES, is a rationale for its inclusion provided? If YES, reference:	<i>No</i>
11. Does the proposal include use of combining characters and/or use of composite sequences? If YES, is a rationale for such use provided? If YES, reference: Is a list of composite sequences and their corresponding glyph images (graphic symbols) provided? If YES, reference:	<i>Yes</i> <i>Yes</i> <i>Combining signs</i> <i>No</i>
12. Does the proposal contain characters with any special properties such as control function or similar semantics? If YES, describe in detail (include attachment if necessary)	<i>Yes</i> <i>Virama</i> <i>see proposal for details</i>
13. Does the proposal contain any Ideographic compatibility characters? If YES, are the equivalent corresponding unified ideographic characters identified? If YES, reference:	<i>No</i>
